Azaleas

It is best to give Azalea rooted cuttings protection from wind and sun the first winter to prevent the bark from cracking. This can be done by building frames 1 foot high around the beds and shade with lath or other material. Also it is well to hold up on fertilizers after July and not to water much after Sept. 1. This acts to harden off the wood, making them much harder against severe cold weather.

AZALEA FALL SPECIAL

The following varieties were rooted cuttings transplanted this summer in peat, 50 per flat. Price \$10.00 per 100 except as otherwise noted.

The DELTA DISPENSER and Proportioner is a mechanical unit designed and built for the application of liquid fertilizers, to be used in the business of growing plant material. It is not a syphon or a venturi but operates on the auto injection principle. Auto injection means that the water through the hose operates the Delta Unit, causing it to inject concentrated fertilizer into the hose in a direct ratio to the amount of water flowing through that hose.

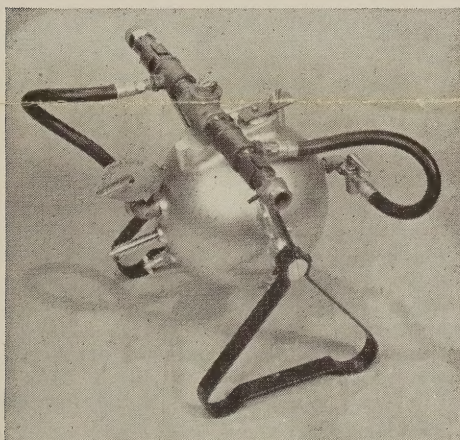

Control of the proportions is at the will of the operator. Eight settings are found on a stainless steel dial. These settings are made up to give from 1 part to 12.5 parts of water up to 1 part to 400 parts of water. By merely turning this dial you select the proportion desired to conform to the mixture placed into the Delta as a heavy concentrate.

A membrane of thin rubber is used to separate the water from the concentrate within the sphere of the Delta. This membrane is never on a stretch or strain but merely acts as a separator. The water, which is metered into the sphere, pushes against the concentrate separated from it by this membrane, displacing it into the hose line, where it mixes with the water. Attached to this membrane or separator is a brass rod which projects to the outside of the sphere. This rod travels with the membrane and acts as an indicator to tell the operator when the unit is emptied and should be refilled.

All openings through which the fertilizer passes are $\frac{1}{4}$ inch in size and capable of passing any undissolved particles in the concentrate.

Brass and bronze fittings are used throughout. One of them, the Binks pressure stopcock, is made of the best brass obtainable. They are spring tightened and remain in adjustment. Aluminum is used in casting the sphere, for it is resistant to the action of the acids which are used in most fertilizers. It is $\frac{3}{8}$ in. thick and is designed to tolerate up to 125 lbs. water pressure.

Any solid material which will mix with water to make a concentrate which will stay in suspension can be used in the Delta Units. If it is possible to do so, the mixture should be heavy enough to use the lower settings on the unit down to 1-400, since this will produce more gallons of mixture through the hose for each gallon of concentrate and make filling less frequent.

12 ins. wide, 17 ins. high, 14 ins. long.
One-gallon Delta Dispenser portable by hand.

\$75.00

The delivery of concentrate from the Delta Unit may be stopped and started by merely shutting off a stopcock in the concentrate line. In this way it is possible to obtain clear water without disconnecting the hose from the unit.

Using a setting of 1-400, a one-gallon Delta Unit will furnish 400 gallons of properly mixed fertilizer, the five-gallon will furnish 2000 gallons and the fifteen-gallon unit will deliver 6000 gallons. Obviously this is the way to apply liquid fertilizers. You do not need a special fertilizer line from a tank; this eliminates the upkeep on such an installation. You can use the pressure of the water mains and not depend upon the drop from a tank, which often does not give adequate volume. With a Delta you can change from one type of nutrient to another in a few minutes, since the mixture is in a concentrated form and may be placed into a container and saved for another time.
